

ADM: Adaptive Density Modulation

Key Formulas:

$F(x) = [f_{xy}, f_{xz}, f_{yz}] \in \mathbb{R}^{(3d)}$ (feature encoding)

$\Delta\rho(x) = \tanh(MLP_{\Delta}(F(x))) \cdot r$, $c(x) = \sigma(MLP_c(F(x)))$ (offset + confidence)

$\rho_{final}(x) = \rho_{base}(x) + c(x) \cdot \Delta\rho(x)$ (confidence-weighted modulation)
